Cable-routing device**Abstract**

10 The invention relates to a cable-routing device comprising
links that are open at the ends, joined together in pivoting
fashion and can be angled relative to each other in at least
two directions, said links being arranged one behind the other
in the longitudinal direction of the cable-routing device and
15 forming at least one guide channel by means of guide elements
located radially outwards, where tensile force-absorbing pivot-
ing joints are located between links joined together in pivot-
ing fashion within the cable-routing device and the links each
display corresponding joint elements. In order to provide a
20 cable-routing device that is capable of absorbing high tensile
forces and/or thrust, especially in the longitudinal direction,
and whose assembly and/or disassembly is facilitated, at least
one pivoting joint (6, 7) is designed in such a way that, in
order to form and/or disconnect the pivoting joint, the respec-
25 tive links (2) and/or joint elements to be joined to one an-
other and/or disconnected from one another can be joined and/or
separated in a direction (8) that encloses an angle relative to
the longitudinal axis (9) of the cable-routing device. (fig. 2)
